For customers who need to migrate their applications across platforms, our approach facilitates migration in a reliable and predictable manner. Unlike more expensive and ad-hoc solutions from our competitors, our process reduces overall risk, uncertainty and cost of such large migration exercises.

From Agitech's past experience in migration/reengineering, drivers for migration include higher costs in maintenance of legacy applications, technology limitations in legacy applications and platforms, adoption of open source wave, conversion of two tier to n tier applications, application consolidation, lack of vendor support for legacy applications and lack of skilled resources for legacy application maintenance and development. Agitech understands these drivers of migration/reengineering and has devised a detailed methodology. Agitech supports two types of migrations:

- **Technology Migration**
Legacy applications to multi-tier applications based on J2EE or .Net

- **Platform Migration**
Applications running on old server platforms that needs to be ported to upgraded server platforms.
