Architectures are in place to allow different parts of the organization to fit together and communicate smoothly between each other and the outside world. They provide a common set of instructions, rules and interfaces to facilitate clear and accurate conversations between all the different systems that run a client's business. Problems arise from architectures that are not able to adapt with changes in business requirements. Our enterprise architecture consulting includes the following phases:

- EA Initiation - EA vision/charter, strategy, governance model and rollout plan.
- EA Framework Definition – EA domain identification, EA framework selection, EA meta-model, EA lifecycle processes, principles, standards, EA tool evaluation, As-Is EA modeling pilot.
- EA Current State Assessment – Identification of gaps with respect to desired EA maturity level, recommendations to bridge/close the gaps and Implementation roadmap.

We review applications, data, deployment, risks and mitigation strategies to develop an implementation architecture roadmap. We define common, reusable, application frameworks to deliver a common application framework architecture and design. We translate common usage patterns among multiple applications into software framework consisting of extensible services/components with well-defined interfaces.
